PORTFOLIO · QA DOCUMENTATION

QA Documentation Samples

Denis Kurchikov, QA Engineer

Bug report	Checklist	Test cases
full set of attributes	five severity levels	four priority levels

About this document

Three examples of how I write the main types of test documentation: a bug report, a checklist and test cases. The projects, features and data in all examples are fictional: the document shows the format, structure and reasoning behind severity and priority, not real findings.

The severity and priority scales are shared across all examples and are given before the checklist and the test cases.

EXAMPLE 1

Bug report

A full set of attributes, from reproduction steps to environment and attachments. Severity and priority are stated separately, each with a justification.

BUG-001. Buying "Express Repair" adds Credits instead of deducting Crystals

Project	Outland: Frontier (fictional)
Precondition	100+ Crystals (premium currency) on balance
Steps	1) Launch the client. 2) Open the hangar. 3) Click "Express Repair". 4) Note the Crystals and Credits balance. 5) Buy the service for 50 Crystals. 6) Compare the Crystals and Credits balance.
Expected result	Crystals decrease by 50, Credits stay the same
Actual result	Crystals stay the same, Credits increase by 50
Frequency	3 of 3 attempts (consistent)
Severity	Critical: a premium service is granted for free, and extra currency is credited on top
Priority	Critical: the mechanic can be exploited for unlimited currency
Build, environment	Build 13.0.1; Windows 11 (64-bit), Intel Core i7-12700K, NVIDIA GeForce RTX 3070, 32 GB DDR4
Attachments	balance_before.png, balance_after.png, repro_video.mp4

EXAMPLE 2

Severity-based checklist

A checklist for a fictional "Gear crafting system" feature: one check for each severity level.

Severity scale

Blocker	Completely stops work with the product: client crash, impossible to continue.
Critical	Loss or duplication of currency or progress, without a crash.
High	A significant failure that puts progress or data at risk, but is recoverable.
Medium	A feature works incorrectly but does not cause data loss.
Low	A minor glitch or cosmetic issue that does not affect functionality.

#	Area	Check	Expected result	Severity
1	**Stability**	Launching the client and opening the crafting window	The client launches and the crafting window opens without crashes or freezes	**Blocker**
2	**Economy: currency**	Premium currency deduction when buying rare component crafts in the shop	Exactly the listed price is deducted, exactly once per purchase	**Critical**
3	**Progress saving**	Server connection drop while an item is being crafted	After reconnecting, crafting progress is kept or materials are correctly refunded; no double charge	**High**
4	**Functionality**	Crafting time in the UI matches the actual completion time	The item is ready exactly when the UI says, with no discrepancy	**Medium**
5	**Localization**	Tooltip of the "Iron Ore" material in the crafting window	Material name and description have no typos or truncated text	**Low**

The working version of the checklist has a "Status" column: Pass / Pass with cautions / Fail / Blocked. It is filled in during the test run.

EXAMPLE 3

Prioritized test cases

Test cases for a fictional "Muzzle smoke trail" feature: one for each priority level.

Priority scale

Critical	Core behavior of the feature. Without it the feature does not work at all.
High	Noticeably affects the feature in real conditions: different settings, configurations, modes.
Medium	Affects gameplay fairness or performance, but not whether the feature works.
Low	Aesthetics and polish, no effect on gameplay.

TC-01. The smoke trail appears and disappears in sync with the shot · Critical

Preconditions	A weapon with the new effect is available and loaded
Steps	1) Fire a shot. 2) Watch the smoke appear at the muzzle. 3) Wait for the effect to dissipate.
Expected result	The effect appears at the moment of the shot and dissipates after the set time, without getting "stuck"

TC-02. The effect renders correctly at all graphics settings · High

Preconditions	Access to graphics settings
Steps	1) Minimum settings: fire a shot, check the effect. 2) Repeat at medium and maximum settings.
Expected result	At every settings level the effect is present, with no disappearing or distortion

TC-03. Other players see the effect over the network · Medium

Preconditions	Two clients in one match
Steps	1) Player A fires a shot. 2) Player B watches player A from the side. 3) Compare what B sees with A's action.
Expected result	The observer sees the effect in sync, with no delay that gives an advantage

TC-04. Smoke tint matches the lighting on the map · Low

Preconditions	At least two maps with different lighting are available (day and night)
Steps	1) Fire a shot on a day map, note the smoke tint. 2) Fire a shot on a night map. 3) Compare how well the effect blends with the environment.
Expected result	The tint looks appropriate in any lighting; any mismatch affects only aesthetics
